

SCB Fixed Income Fund

Accumulation
SCBFIXEDA

Fund Type / Peer Group

- Fund type: Fixed Income Fund/Cross Investing Fund/Fund that invests with both domestic and foreign investment exposure
- AIMC category: Short Term General Bond

Investment Policy and Strategy

• The Fund invests in government bonds, money market instruments, debt instruments issued by banks established under specific laws, debt instruments of financial institution, private debt instruments, deposits or deposit-equivalent instruments both domestically and/or internationally in an appropriate proportion at each moment by investing abroad on average in a fiscal year not exceeding 79% of the NAV.

The Fund may invest in investment units of mutual funds under management of SCBAM not exceeding 100% of NAV.

• The Fund may consider investing in derivatives for purposes of enhancing the efficiency of portfolio management and/or hedging exchange rate risk which depends on fund manager's discretion.

• Fund's management strategy: The Fund aims to achieve performance higher than the benchmark (Active Management).

Past Performance and Benchmark for the Past 5 Calendar Years (% p.a.)

Definition

Maximum Drawdown refers to the highest percentage loss of the fund over the past 5 years (or since inception if the fund has been established for less than 5 years). It is calculated from the highest unit value to the lowest unit value during the period that the unit value is declining. The Maximum Drawdown is an indicator of the risk of loss from investing in the fund.

Recovering Period is used to give investors an idea of how long it will take from the time of maximum loss of the fund to the recovery of initial investment.

FX Hedging refers to the percentage of investments denominated in foreign currency that are hedged against exchange rate risk.

Portfolio Turnover Ratio (PTR) indicates the trading frequency of securities in the investment portfolio of the fund over a given period. It is calculated by taking the lower value between the total amount of new securities purchased and the total amount of securities sold over the past 1 year, divided by the average NAV of the same period. The fund with high PTR reflects frequent trading by the fund manager which leads to high trading costs. Investors should compare this data with the fund performance in order to evaluate the worthiness of such trading strategy.

Sharpe Ratio is the ratio between the excess return of the fund and the investment risk. It is calculated from the difference between the investment return of the fund and the risk-free rate of return divided of returns for the investment. The Sharpe Ratio reflects how much returns the fund will receive to offset the investment risk of the fund. The fund with a higher Sharpe Ratio means that it is managed more efficiently because it generates higher excess returns given the same level of investment risk.

Alpha is the excess return of the fund relative to the return of its corresponding benchmark. A high alpha indicates that the fund generates higher return than its benchmark which is resulted from the efficiency of the fund manager in securities selection or determining the right timing for investment.

Beta is a measure of the returns of securities in the portfolio in relation to the market as a whole. A beta of less than 1 indicates that the returns of the fund's portfolio are less volatile than the overall market. On the other hand, a beta of greater than 1 indicates that the returns on the portfolio are more volatile than the market return.

Tracking Error The rate of return of the fund has the efficiency to replicate the corresponding benchmark. If the tracking error is low, it implies that the fund is able to generate similar returns to its benchmark efficiently. The fund with high tracking error will have an average rate of return that is more deviated from the benchmark.

Yield to Maturity (YTM) is the rate of return for investing in a debt instrument assuming that the investor holds the asset until its maturity date. It is calculated from the coupon payments to be earned by the investor over the remaining term of the instrument plus the face value due at maturity which are discounted to a present value. YTM is used to measure the rate of return of a fixed income fund which is based on the weighted average YTM of each debt instrument in the portfolio of the fund. As YTM is expressed as an annual percentage rate, it can be used for performance comparison among the fixed income funds with a 'buy and hold' investment strategy and similar investment characteristics.
